### **NEW QUESTION: 2**

You have created several preemptible Linux virtual machine instances using Google Compute Engine. You want to properly shut down your application before the virtual machines are preempted.

What should you do?

- A. Create a shutdown script named `k99.shutdown` in the `/etc/rc.6.d/` directory.
- B. Create a shutdown script registered as a `xinetd` service in Linux and configure a `Stackdriver` endpoint check to call the service.
- C. Create a shutdown script, registered as a `xinetd` service in Linux, and use the `gcloud compute instances add-metadata` command to specify the service URL as the value for a new metadata entry with the key `shutdown-script-url`
- D. Create a shutdown script and use it as the value for a new metadata entry with the key `shutdown-script` in the Cloud Platform Console when you create the new virtual machine instance.

**Answer: D**

Explanation:

Running Shutdown Scripts: Create and run shutdown scripts that execute commands right before an instance is terminated or restarted, on a best-effort basis. This is useful if you rely on automated scripts to start up and shut down instances, allowing instances time to clean up or perform tasks, such as exporting logs, or syncing with other systems.

<https://cloud.google.com/compute/docs/shutdownscript>

To setup Shutdown Scripts, go to GCP console and follow the steps:

Compute Engine -> VM instance -> Create Instance -> (Expand) Management, disks, networking, SSH keys Enter the key "shutdown-script" and proper value
