A. Option C
B. Option D
C. Option B
D. Option A
Answer: D
Explanation:
Agents are applications that reside on client machines logging
into the Cisco ISE network.
Agents can be persistent (like the AnyConnect, Cisco NAC Agent
for Windows and Mac OS X) and remain on the client machine
after installation, even when the client is not logged into the
network. Agents can also be temporal (like the Cisco NAC Web
Agent), removing themselves from the client machine after the
login session has terminated.

Answer: D
Explanation:
Explanation
Scheduled Reserved Instances
Scheduled Reserved Instances (Scheduled Instances) enable you
to purchase capacity reservations that recur on a daily,
weekly, or monthly basis, with a specified start time and
duration, for a one-year term. You reserve the capacity in
advance, so that you know it is available when you need it. You
pay for the time that the instances are scheduled, even if you
do not use them.
Scheduled Instances are a good choice for workloads that do not
run continuously, but do run on a regular schedule. For
example, you can use Scheduled Instances for an application
that runs during business hours or for batch processing that
runs at the end of the week.
If you require a capacity reservation on a continuous basis,
Reserved Instances might meet your needs and decrease costs.
How Scheduled Instances Work
Amazon EC2 sets aside pools of EC2 instances in each

Availability Zone for use as Scheduled Instances. Each pool supports a specific combination of instance type, operating system, and network.
To get started, you must search for an available schedule. You can search across multiple pools or a single pool. After you locate a suitable schedule, purchase it.
You must launch your Scheduled Instances during their scheduled time periods, using a launch configuration that matches the following attributes of the schedule that you purchased: instance type, Availability Zone, network, and platform. When you do so, Amazon EC2 launches EC2 instances on your behalf, based on the specified launch specification. Amazon EC2 must ensure that the EC2 instances have terminated by the end of the current scheduled time period so that the capacity is available for any other Scheduled Instances it is reserved for. Therefore, Amazon EC2 terminates the EC2 instances three minutes before the end of the current scheduled time period.
You can't stop or reboot Scheduled Instances, but you can terminate them manually as needed. If you terminate a Scheduled Instance before its current scheduled time period ends, you can launch it again after a few minutes. Otherwise, you must wait until the next scheduled time period.
The following diagram illustrates the lifecycle of a Scheduled Instance.
