**NEW QUESTION: 1**

Which three features are considered part of the IPv6 first-hop security suite? (Choose three.)

- A. DHCP guard
- B. RA guard
- C. destination guard

- D. ICMP guard
- E. DNS guard
- F. DoS guard

**Answer: A,B,C**

Explanation:

Cisco IOS has (at least) these IPv6 first-hop security features: IPv6 RA Guard rejects fake RA messages coming from host (non-router) ports (not sure whether it handles all possible IPv6 header fragmentation attacks). Interestingly, it can also validate the contents of RA messages (configuration flags, list of prefixes) received through router-facing ports, potentially giving you a safeguard against an attack of fat fingers. DHCPv6 Guard blocks DHCPv6 messages coming from unauthorized DHCPv6 servers and relays. Like IPv6 RA Guard it also validates the DHCPv6 replies coming from authorized DHCPv6 servers, potentially providing protection against DHCPv6 server misconfiguration. IPv6 Snooping and device tracking builds a IPv6 First-Hop Security Binding Table (nicer name for ND table) by monitoring DHCPv6 and ND messages as well as regular IPv6 traffic. The binding table can be used to stop ND spoofing (in IPv4 world we'd call this feature DHCP Snooping and Dynamic ARP Inspection). IPv6 Source Guard uses the IPv6 First-Hop Security Binding Table to drop traffic from unknown sources or bogus IPv6 addresses not in the binding table. The switch also tries to recover from lost address information, querying DHCPv6 server or using IPv6 neighbor discovery to verify the source IPv6 address after dropping the offending packet(s). IPv6 Prefix Guard is denies illegal off-subnet traffic. It uses information gleaned from RA messages and IA\_PD option of DHCPv6 replies (delegated prefixes) to build the table of valid prefixes. IPv6 Destination Guard drops IPv6 traffic sent to directly connected destination addresses not in IPv6 First-Hop Security Binding Table, effectively stopping ND exhaustion attacks.

**Answer:**

Explanation:

- 1 - Encrypt the on-premises VHD by using BitLocker without a TPM. Upload the VM to Azure Storage.
- 2 - Run the Azure PowerShell command `Set-AzureRmVMOSDisk`.
- 3 - Run the Azure PowerShell command `Set-AzureRmVMDiskEncryptionExtension`.

Explanation:

Step 1: Encrypt the on-premises VHD by using BitLocker without a TPM. Upload the VM to Azure Storage  
Step 2: Run the Azure PowerShell command `Set-AzureRmVMOSDisk` To use an existing disk instead of creating a new disk you can use the `Set-AzureRmVMOSDisk` command.

Example:

```
$osDiskName = $vmname+'_osDisk'  
$osDiskCaching = 'ReadWrite'  
$osDiskVhdUri =  
"https://$stname.blob.core.windows.net/vhds/" + $vmname + "_os.vhd"  
"
```

```
$vm = Set-AzureRmVMOSDisk -VM $vm -VhdUri $osDiskVhdUri -name  
$osDiskName -Create  
Step 3: Run the Azure PowerShell command  
Set-AzureRmVMDiskEncryptionExtension Use the  
Set-AzureRmVMDiskEncryptionExtension cmdlet to enable encryption on  
a running IaaS virtual machine in Azure.
```

Incorrect:

Not TPM: BitLocker can work with or without a TPM. A TPM is a tamper resistant security chip on the system board that will hold the keys for encryption and check the integrity of the boot sequence and allows the most secure BitLocker implementation. A VM does not have a TPM.
