D. ãƒ'ãƒ–ãƒªãƒƒã‚¯ã‚¯ãƒ©ã‚¦ãƒ‰å†…

Answer: D
Explanation:
Explanation
A private cloud is hosted in your datacenter. Therefore, you cannot close your datacenter if you are using a private cloud.
A public cloud is hosted externally, for example, in Microsoft Azure. An organization that hosts its infrastructure in a public cloud can close its data center.
Public cloud is the most common deployment model. In this case, you have no local hardware to manage or keep up-to-date everything runs on your cloud provider's hardware.
Microsoft Azure is an example of a public cloud provider.
In a private cloud, you create a cloud environment in your own datacenter and provide self-service access to compute resources to users in your organization.
This offers a simulation of a public cloud to your users, but you remain completely responsible for the purchase and maintenance of the hardware and software services you provide.

NEW QUESTION: 2
Which systems require real-time notification?
A. Systems whose policy and configuration are subject to compliance requirements
B. Systems whose policy and configuration are relatively stable, but need a fast reaction time to infrequent policy or configuration changes
C. Systems that rely on the polling interval to update the agent
D. Systems whose policy and configuration are relatively stable and that are consistent within the deployment
Answer: B

NEW QUESTION: 3
Which statement about the attributes from a Management Information Base (MIB) import is TRUE?
A. They can only be accessed by a model created from the imported MIB model type.
B. They can be accessed from all Device, Interface and Application model types.
C. They can be context-sensitive for devices.
D. They are duplicated on each model.
Answer: B

NEW QUESTION: 4
You are designing YAML-based Azure pipelines for the apps shown

in the following table.

You need to configure the YAML strategy value for each app. The solution must minimize app downtime.
Which value should you configure for each app? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.

Answer:
Explanation:

Explanation

App1: rolling
A rolling deployment replaces instances of the previous version of an application with instances of the new version of the application on a fixed set of virtual machines (rolling set) in each iteration.
App2: canary
Canary deployment strategy is an advanced deployment strategy that helps mitigate the risk involved in rolling out new versions of applications. By using this strategy, you can roll out the changes to a small subset of servers first. As you gain more confidence in the new version, you can release it to more servers in your infrastructure and route more traffic to it.
