- B. VVols
- C. Asynchronous Replication
- D. Synchronous Replication

**Answer: A**

**NEW QUESTION: 3**

MapMySite is an AWS VPC feature that allows you to map your on-premises database instances to a VPC. Which of the following is a requirement for using MapMySite?

- A. VPC must be in the same Availability Zone as the on-premises database instances.
- B. The on-premises database instances must be in a private subnet.
- C. The VPC must be in a private subnet.
- D. The on-premises database instances must be in a public subnet.

**Answer: A**

Explanation:

Explanation

A Virtual Private Cloud (VPC) is a virtual network dedicated to the user's AWS account. It enables the user to launch AWS resources, such as RDS into a virtual network that the user has defined. Subnets are segments of a VPC's IP address range that the user can designate to a group of VPC resources based on the security and operational needs.

A DB subnet group is a collection of subnets (generally private) that a user can create in a VPC and assign to the RDS DB instances. A DB subnet group allows the user to specify a particular VPC when creating the DB instances. Each DB subnet group should have subnets in at least two Availability Zones in a given region.
