**NEW QUESTION: 1** Which Cisco Nexus feature is best managed with DCNM-SAN?  
**A.** VSS **B.** virtual switches **C.** A-AAA **D.** domain parameters

**Answer: D**  
**Explanation:** The Fibre Channel domain (fcdomain) feature performs principal switch selection, domain ID distribution, FC ID allocation, and fabric reconfiguration functions as described in the FC-SW-2 standards. The domains are configured on a per VSAN basis. If you do not configure a domain ID, the local switch uses a random ID. This section describes each fcdomain phase:  
\*Principal switch selection - This phase guarantees the selection of a unique principal switch across the fabric.  
\*Domain ID distribution - This phase guarantees each switch in the fabric obtains a unique domain ID.  
\*FC ID allocation - This phase guarantees a unique FC ID assignment to each device attached to the corresponding switch in the fabric.  
\*Fabric reconfiguration - This phase guarantees a resynchronization of all switches in the fabric to ensure they simultaneously restart a new principal switch selection phase.
