³ãf†ãf³ãf-ãf-ãf¼ãf^ã, 'ã½æ^·ã·-ã·¾ã·™ã€·**Answer: D**Explanation:
You should create a virtual machine template by using a
complete instance of SQL Server 2016. You use the sysprep tool
to prepare a complete instance of SQL Server 2016. By using a
complete instance, SQL Server, the network, and the users are
all created, and the system cannot be reconfigured during the
installation process.Incorrect Answers:A: You should not
provision 10 Azure virtual machines that each contain SQL
Server 2016, installed by using the default settings. A virtual
machine created by using the Azure library provides you with a
standard installation, and the requirements call for a custom
installation. The instance will need some specific parameters
for your custom installation. Therefore, you would have to
customize each Azure virtual machine.B: You should not create
an installation configuration file and perform unattended
installations of SQL Server 2016. This could be a valid option,
but you would need to prepare 10 installations, and this would
require a lot of effort. There are also some other
administrative actions that must be performed that could also
increase the amount of effort required, such as user database
configuration.C: You should not create a virtual machine
template by using a prepared instance of SQL Server 2016. A
virtual machine template that contains a prepared instance of
SQL Server could be modified during the installation process.
For example, some features could be added or removed during the
installation process. The prepared instance contains a
preconfigured version of SQL Server without network and user
configurations.References:
