NEW QUESTION: 1
Informationen zum Erkennen nicht autorisierter Eingaben von einem Terminal werden BEST bereitgestellt von:
A. Benutzerfehlerbericht.
B. Transaktionsjournal.
C. Ausdruck des Konsolenprotokolls.

D. automatische Suspense-Dateiliste.
Answer: B
Explanation:
Erläuterung:
Das Transaktionsjournal zeichnet alle Transaktionsaktivitäten auf, die dann mit den autorisierten Quelldokumenten verglichen werden können, um nicht autorisierte Eingaben zu identifizieren. Ein Ausdruck des Konsolenprotokolls ist nicht die beste Lösung, da keine Aktivitäten von einem bestimmten Terminal aufgezeichnet werden. Eine automatische Suspense-Dateiliste listet nur die Transaktionsaktivitäten auf, bei denen ein Bearbeitungsfehler aufgetreten ist, während der Benutzerfehlerbericht nur Eingaben auflistet, die zu einem Bearbeitungsfehler geführt haben.

NEW QUESTION: 2
You are planning the configuration for IPMP (IP Multipathing). Best practice dictates that you must ensure that there is at least one neighbor on each subnet that responds to ICMP echo request probes to detect link failure
Which two of the following statements are true regarding the link failure detection process? (Choose two.)
A. Without test partners, in.mpathd cannot detect the failure of a subinterface.
B. The default failure detection time is 60 seconds (12 consecutive probes).
C. Arbitrary hosts on the subnet are detected by sending an "all routers" (224.0.0.2) multicast packet.
D. By default, in.mpathd selects the default router as the only test partner.
E. Arbitrary hosts on the subnet are detected by examining the ARP cache (Internet-to-MAC address translation table).
F. Arbitrary hosts on the subnet are detected by sending an "all hosts" (224.0.0.1) multicast packet
Answer: B,F

Answer: C
Explanation:
However, because you can encrypt a copy of an unencrypted DB
snapshot, you can effectively add encryption to an unencrypted
DB instance. That is, you can create a snapshot of your DB
instance, and then create an encrypted copy of that snapshot.
You can then restore a DB instance from the encrypted snapshot,
and thus you have an encrypted copy of your original DB
instance DB instances that are encrypted can't be modified to
disable encryption.
You can't have an encrypted read replica of an unencrypted DB
instance or an unencrypted read replica of an encrypted DB
instance.
Encrypted read replicas must be encrypted with the same key as
the source DB instance when both are in the same AWS Region.
You can't restore an unencrypted backup or snapshot to an
encrypted DB instance.
To copy an encrypted snapshot from one AWS Region to another,
you must specify the KMS key identifier of the destination AWS
Region. This is because KMS encryption keys are specific to the
AWS Region that they are created in.
