NEW QUESTION: 1A one-way hash provides which of the following?

A. Confidentiality**B.** Authentication**C.** Availability**D.** Integrity

Answer: DExplanation:A one-way hash is a function that takes a variable-length string a message, and compresses and transforms it into a fixed length value referred to as a hash value. It provides integrity, but no confidentiality, availability or authentication.Source: WALLHOFF, John, CBK#5 Cryptography (CISSP Study Guide), April 2002 (page5).

NEW QUESTION: 2HUAWEI HiAI Which tool does the platform support to integrate with?**A.** MyEclipse**B.** Spider**C.** Jupyter Notebook**D.**

Android Studio**Answer: D**

NEW QUESTION: 3A utility company has an existing web application developed in Java for Websphere Application Server and is currently running on premises. They want to move that application to IBM Cloud.The existing application is stateful and maintains persistent session data using JavaEE standard HTTP sessions. Which Bluemix service should be used to avoid making any change to the application code and maintain the

statefulness of the application?**A.** Object Storage**B.** Compose for Redis**C.** MySQL**D.** Session Cache**Answer: D**
Explanation:
Explanation/Reference:Session Cache: When bound to a program, this service enables persistence for all sessions across multiple instances of the application. In the event of a failure, sessions are seamlessly recovered.**References:**

NEW QUESTION: 4 DRAG DROP You use Microsoft SQL Server to develop a database that has two tables named Div1Cust and Div2Cust. Each table has columns named DivisionID and CustomerID. You need to write a query that meets the following requirements: The rows in Div1Cust must be combined with the rows in Div2Cust. The result set must have columns named Division and Customer. Duplicates must be not retained. Which three Transact-SQL statements should you use? (To answer, move the appropriate statements from the list of statements to the answer area and arrange them in the correct order.)
Select and Place:
Answer: **Explanation:**
Explanation/Reference:**Explanation:**The UNION ALL command is equal to the UNION command, except that UNION ALL selects all values. The difference between Union and Union all is that Union all will not eliminate duplicate rows, instead it just pulls all rows from all tables fitting your query specifics and combines them into a table. We should also use the DISTINCT keyword in the third SELECT statement.
Incorrect: The UNION command is used to select related information from two tables, much like the JOIN command. However, when using the UNION command all selected columns need to be of the same data type. With UNION, only distinct values are selected.
