below.ExplanationStep 1: Click Create a resource in the portal.
Step 2: Enter Virtual network in the Search the Marketplace box
at the top of the New pane that appears. Click Virtual network
when it appears in the search results.Step 3: Select Classic in
the Select a deployment model box in the Virtual Network pane
that appears, then click Create.Step 4: Enter the following
values on the Create virtual network (classic) pane and then
click Create:Name: VNET1005aAddress space: 10.0.0.0/16Subnet
name: subnet0Resource group: Create newSubnet address range:
10.0.0.0/24Subscription and location: Select your subscription

and location. Step 5: Repeat steps 3-5 for VNET1005b (10.1.0.0/16, 10.1.0.0/24), and for VNET1005c 10.2.0.0/16, 10.2.0.0/24). References: <https://docs.microsoft.com/en-us/azure/virtual-network/create-virtual-network-classic>

NEW QUESTION: 2 The EMP table has some discrepancy in data entry with a particular employee ID. You execute the query as shown in the Exhibit to retrieve all versions of the row that exist between two SCNs. View the Exhibit. Which two statements about the results of the query shown in the Exhibit are correct? (Choose two.) Exhibit: **A.** The LAST_SCN value in the second row is NULL, which means that the version of the row no longer exists because it was deleted. **B.** The LAST_SCN value in the third row is 6636280, which means that the version of row exists above SCN 6636280. **C.** The LAST_SCN value in the second row is NULL, which means that the version of the row still exists at SCN 6636300. **D.** The LAST_SCN value in the first row is NULL, which means that the versions of the row still exist at SCN 6636300. **Answer: A, D** Explanation: Explanation/Reference: Explanation: Using Oracle Flashback Transaction Query with Oracle Flashback Version Query (link) The query uses Oracle Flashback Version Query pseudocolumns: SELECT versions_xid XID, versions_startscn START_SCN, versions_endscn END_SCN, versions_operation OPERATION, empname, salary FROM emp VERSIONS BETWEEN SCN MINVALUE AND MAXVALUE WHERE empno = 111; Results are similar to: 3 rows selected. The results table rows are in descending chronological order.

NEW QUESTION: 3 During an IS audit, auditor has observed that authentication and authorization steps are split into two functions and there is a possibility to force the authorization step to be completed before the authentication step. Which of the following technique an attacker could use to force authorization step before authentication? **A.** Race Condition **B.** Traffic analysis **C.** Masquerading **D.** Eavesdropping **Answer: A** Explanation: A race condition is when processes carry out their tasks on a shared resource in an incorrect order. A race condition is possible when two or more processes use a shared resource, as in data within a variable. It is important that the processes carry out their functionality in the correct sequence. If process 2 carried out its task on the data before process 1, the result will be much different than if process 1 carried out its tasks on the data before process 2. In software, when the authentication and authorization steps are split into two functions, there is a possibility an attacker could use a race condition to force the authorization step to be completed before the authentication step. This would be a flaw in the software that the attacker has figured out how to exploit. A race condition occurs when two or more processes use the same resource and the sequences of steps within the software can be carried out in an improper order, something that can drastically affect the output. So, an attacker can force the

authorization step to take place before the authentication step and gain unauthorized access to a resource. The following answers are incorrect: Eavesdropping - is the act of secretly listening to the private conversation of others without their consent, as defined by Black's Law Dictionary. This is commonly thought to be unethical and there is an old adage that "eavesdroppers seldom hear anything good of themselves...eavesdroppers always try to listen to matters that concern them." Traffic analysis - is the process of intercepting and examining messages in order to deduce information from patterns in communication. It can be performed even when the messages are encrypted and cannot be decrypted. In general, the greater the number of messages observed, or even intercepted and stored, the more can be inferred from the traffic. Traffic analysis can be performed in the context of military intelligence, counter-intelligence, or pattern-of-life analysis, and is a concern in computer security. Masquerading - A masquerade attack is an attack that uses a fake identity, such as a network identity, to gain unauthorized access to personal computer information through legitimate access identification. If an authorization process is not fully protected, it can become extremely vulnerable to a masquerade attack. Masquerade attacks can be perpetrated using stolen passwords and logons, by locating gaps in programs, or by finding a way around the authentication process. The attack can be triggered either by someone within the organization or by an outsider if the organization is connected to a public network. The amount of access masquerade attackers get depends on the level of authorization they've managed to attain. As such, masquerade attackers can have a full smorgasbord of cyber crime opportunities if they've gained the highest access authority to a business organization. Personal attacks, although less common, can also be harmful.
