Explanation

Box 1: sys.dm_tran_locks

sys.dm_tran_locks returns information about currently active lock manager resources in SQL Server 2017.

Each row represents a currently active request to the lock manager for a lock that has been granted or is waiting to be granted.

Box 2: sys.dm_os_waiting_tasks

sys.dm_tran_locks.lock_owner_address is the memory address of the internal data structure that is used to track this request. This column can be joined the with resource_address column in sys.dm_os_waiting_tasks.

NEW QUESTION: 4

- A. Option A
- B. Option C
- C. Option E
- D. Option B
- E. Option D

Answer: B,C

Explanation:

The first step when allowing a virtual machine to have connectivity to a physical network is to create an external virtual switch using Virtual Switch Manager in Hyper-V Manager. The additional step that is necessary when using SR-IOV is to ensure the checkbox is checked when the virtual switch is being created. It is not possible to change a "non SR-IOV mode" external virtual switch into an "SR-IOV mode" switch. The choice must be made at switch creation time. Thus you should first delete the existing virtual switch and then recreate it. E: Once a virtual switch has been created, the next step is to configure a virtual machine. SR-IOV in Windows Server "8" is supported on x64 editions of Windows "8" as a guest operating system (as in Windows "8" Server, and Windows "8" client x64, but not x86 client). We have rearranged the settings for a virtual machine to introduce sub-nodes under a network adapter, one of which is the hardware acceleration node. At the bottom is a checkbox to enable SR-IOV.
