NEW QUESTION: 1
The current ZFS configuration on your server is:
pool1 124K 3.91G 32K /pool1
pool1/data 31K 3.91G 31K /data
You need to create a new file system named /data2. /data2 will be a copy of the /data file system.
You need to conserve disk space on this server whenever possible.
Which option should you choose to create /data2, which will be

a read writeable copy of the /data file system, while
minimizing the amount of total disk space used in pool1?
A. zfssnapshot pool1/
=/data2,comptession=on pool1/
B. zfs snapshot pool1/ clone -o
mountpoint=/data2 pool1/ pool1/data2
C. zfs create snapshot pool1/ clone -o
mountpoint=/data2 pool1//data2
D. zfs snapshot pool1/ clone -o
mountpoint=/data2 ocompression=onpool1/
pool1/data2
E. zfs create snapshot pool1/ sendpool1/
|zfs recv pool1/data2
F. zfs set mountpoint=/data2 compression=on pool1/data2
Answer: D
Explanation:
zfs snapshot [-r] [-o property=value] ...
|
Creates a snapshot with the given name. All previous
modifications by successful system calls to
the file system are part of the snapshot
zfs clone [-p] [-o property=value] ... snapshot
filesystem|volume
Creates a clone of the given snapshot.
Note:
Because snapshots are fast and low overhead, they can be used
extensively without great
concern for system performance or disk use .
With ZFS you can not only create snapshot but create a clone of
a snapshot.
A clone is a writable volume or file system whose initial
contents are the same as the dataset from
which it was created. As with snapshots, creating a clone is
nearly instantaneous, and initially
consumes no additional disk space. In addition, you can
snapshot a clone.

Clones can only be created from a snapshot. When a snapshot is
cloned, it creates an implicit
dependency between the parent and child.
