NEW QUESTION: 1

A. Option D
B. Option A
C. Option C
D. Option B
Answer: B
Explanation:
Explanation
Amazon RDS Multi-AZ deployments provide enhanced availability and durability for Database (DB) Instances, making them a natural fit for production database workloads. When you provision a Multi-AZ DB Instance, Amazon RDS automatically creates a primary DB Instance and synchronously replicates the data to a standby instance in a different Availability Zone (AZ). Cach AZ runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable.
In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby (or to a read replica in the case of Amazon Aurora), so that you can resume database operations as soon as the failover is complete.
The below diagram from the AWS documentation shows how this is configured.

Option B is invalid because the replication is synchronous.
Option C and D are invalid because this is built around AZ and not regions.

NEW QUESTION: 3
Refer to the Exhibit. A storage administrator is not seeing full utilization of all bandwidth from an ESXi host. The vSphere administrator observes the adapter details, as shown in the Exhibit.

What is the probable cause of this issue?
A. There are no virtual machines on the host.
B. Another path needs to be used to allow full utilization of the bandwidth.
C. No traffic is being sent across it because a path failed.
D. The array is not setup to use the correct multipathing policy.
Answer: C

NEW QUESTION: 4
You have an Exchange Server 2013 organization that contains two servers named EX1 and EX2.
EX1 and EX2 are the members of a database availability group (DAG) named DAG1.
EX1 and EX2 each contain a copy of a mailbox database named DB1. DB1 is configured to retain deleted items for 120 days.
At the end of each month, the mailbox databases on EX1 are backed up to tape. The monthly backups are retained for two years.
A user named User1 has a mailbox in DB1.
User1 discovers that a mailbox folder that contained important email messages was deleted more than six months ago.
You need to recover the deleted mailbox folder without affecting any other users who have mailboxes in DB1.
Which three actions should you perform? (Each correct answer presents part of the solution. Choose three.)
A. Restore DB1 from the tape backup to an alternate location.
B. Run the New-MaiboxRestoreRequest cmdlet.
C. Restore DB1 from the tape backup to the database's original location.
D. Run the New-MailboxDatabase cmdlet and specify the Recovery parameter.
E. Run the New-Mailbox cmdlet and specify the Recovery parameter.
Answer: A,B,D
Explanation:
Explanation/Reference:
Explanation:
Recovery Database
A recovery database is a special kind of mailbox database that allows you to mount a restored mailbox database and extract data from the restored database as part of a recovery operation. You can use the New-MailboxRestoreRequest cmdlet to extract data from a recovery database. After extraction, the data can be exported to a folder or merged into an existing

mailbox. Recovery databases enable you to recover data from a backup or copy of a database without disturbing user access to current data.
A: Use the New-MailboxRestoreRequest cmdlet to restore a soft-deleted or disconnected mailbox. This cmdlet starts the process of moving content from the soft-deleted mailbox, disabled mailbox, or any mailbox in a recovery database into a connected primary or archive mailbox.
B: Use the New-MailboxDatabase cmdlet to create a mailbox database object in the database container in Active Directory.
