NEW QUESTION: 2

A senior employee received a suspicious email from another executive requesting an urgent wire transfer. Which of the following types of attacks is likely occurring?

- A. Spear phishing
- B. Vishing
- C. Business email compromise
- D. Whaling

Answer: A

NEW QUESTION: 3

Which of the following are valid authentication user group types on a FortiGate unit? (Select all that apply.)

- A. Local
- B. Directory Service
- C. PKI
- D. LDAP

E. Firewall

Answer: B,E

NEW QUESTION: 4

What does this EEM applet event accomplish?

```
"event snmp oid 1.3.6.1.3.7.1.5.1.2.4.2.9 get-type next
entry-op g entry-val 75 poll-interval 5"
```

- A. Upon the value reaching 75%, a SNMP event is generated and sent to the trap server.
- B. It reads an SNMP variable, and when the value exceeds 75% for live polling cycles.
- C. It issues email when the value is greater than 75% for five polling cycles.
- D. It presents a SNMP variable that can be interrogated.

Answer: B

Explanation:

Explanation

EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or reach a threshold. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration.

To specify the event criteria for an Embedded Event Manager (EEM) applet that is run by sampling Simple Network Management Protocol (SNMP) object identifier values, use the event snmp command in applet configuration mode.

```
event snmp oid oid-value get-type {exact | next} entry-op
operator entry-val entryvalue
[exit-comb {or | and}] [exit-op operator] [exit-val exit-value]
[exit-time exit-timevalue] poll-interval poll-int-value
+ oid: Specifies the SNMP object identifier (object ID)
+ get-type: Specifies the type of SNMP get operation to be
applied to the object ID specified by the oid-value argument.
- next - Retrieves the object ID that is the alphanumeric
successor to the object ID specified by the oid-value argument.
+ entry-op: Compares the contents of the current object ID with
the entry value using the specified operator. If there is a
match, an event is triggered and event monitoring is disabled
until the exit criteria are met.
+ entry-val: Specifies the value with which the contents of the
current object ID are compared to decide if an SNMP event
should be raised.
+ exit-op: Compares the contents of the current object ID with
the exit value using the specified operator. If there is a
match, an event is triggered and event monitoring is reenabled.
+ poll-interval: Specifies the time interval between
consecutive polls (in seconds) Reference:
