Answer:
Explanation:

Explanation:
Box 1: 6
Two out of three update domains would be available, each with
at least 3 VMs.
An update domain is a group of VMs and underlying physical
hardware that can be rebooted at the same time.
As you create VMs within an availability set, the Azure
platform automatically distributes your VMs across these update
domains. This approach ensures that at least one instance of
your application always remains running as the Azure platform
undergoes periodic maintenance.
Box 2: the West Europe region and the RG1 resource group

NEW QUESTION: 3
A 72-year-old woman suffers from a major depressive episode.
She has a history of coronary artery disease, atrial
fibrillation on anticoagulation therapy, sick sinus syndrome,
glaucoma, and chronic obstructive pulmonary disease.
Which of the following medications is most appropriate for the
treatment of her depression?
A. Doxepin
B. Escitalopram
C. Nortriptyline
D. Amitriptyline
E. Fluvoxamine
Answer: B
Explanation:
Explanation
In older adults, selection of antidepressant medication should
be done with various considerations in mind, most notably side

effects and risk of drug-drug interactions. The tricyclic antidepressants (TCAs), as discussed on question 50, have various side effects including cardiac conduction abnormalities and drug-drug interactions that make them undesirable for the treatment of depression in older adults. A selective serotonin reuptake inhibitor is more favorable than a TCA in this patient. Fluvoxamine has a high risk for drug-drug interactions, whereas escitalopram does not. Fluvoxamine also has high protein binding, and can therefore interact with anticoagulant medications, such a warfarin. Therefore, of the medications listed, escitalopram is the most appropriate in this patient. In older adults, psychotropic medications should be started at a low dose and titrated up slowly to the lowest effective dose.
