NEW QUESTION: 1

A database is running on an Amazon RDS Multi-AZ DB instance. A recent security audit found the database to be out of compliance because it was not encrypted.

Which approach will resolve the encryption requirement?

- A.** Encrypt the standby replica in the secondary Availability Zone and promote it to the primary instance.
- B.** Create a new encrypted Amazon EBS volume and attach it to the instance.
- C.** Take a snapshot of the RDS instance, copy and encrypt the snapshot, and then restore to the new RDS instance.

D. Log in to the RDS console and select the encryption box to encrypt the database.

Answer: C

Explanation:

<https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/Overview.Encryption.html#Overview.Encryption.Enabling> You can only enable encryption for an Amazon RDS DB instance when you create it, not after the DB instance is created.

However, because you can encrypt a copy of an unencrypted DB snapshot, you can effectively add encryption to an unencrypted DB instance. That is, you can create a snapshot of your DB instance, and then create an encrypted copy of that snapshot. You can then restore a DB instance from the encrypted snapshot, and thus you have an encrypted copy of your original DB instance.

NEW QUESTION: 2

You are planning the implementation of an order processing web service that will contain microservices hosted in an Azure Service Fabric cluster.

You need to recommend a solution to provide developers with the ability to proactively identify and fix performance issues. The developers must be able to simulate user connections to the order processing web service from the Internet, as well as simulate user transactions. The developers must be notified if the goals for the transaction response times are not met.

What should you include in the recommendation?

- A.** container health
- B.** Application Insights
- C.** Service Fabric Analytics
- D.** Azure Network Watcher
