- E. configuration of virtual-to-physical network interface mapping

Answer: D

Explanation:

Explanation

What does a TRC definition include?

- * Definition of server model and local components (CPU, RAM, adapters, local storage) at the orderable part number level.
- * Required RAID configuration (e.g. RAID5, RAID10, etc.) - including battery backup cache or SuperCap - when the TRC uses DAS storage
- * Guidance on hardware installation and basic setup (e.g. [clickhere](#)).
- * [ClickherefordetailedCiscoUCSserverdocumentation](#) regarding hardware configuration procedures.
- * Configuration of Virtual-to-physical network interface mapping is design-dependent and not included in TRC definition.
- * Configuration of adapters (such as Cisco VIC, 3rd-party CNA / NIC / HBA) is design-dependent and not included in TRC definition.
- * Configuration settings or step by step procedures for hardware BIOS, firmware, drivers, RAID setup are not included. [ClickherefordetailedCiscoUCSserverdocumentation](#).
- * Design, installation and configuration of external hardware is not included in TRC definition, such as:
 - * Network routing and switching (e.g. routers, gateways, MCUs, ethernet/FC/FCoE switches, Cisco Catalyst/Nexus/MDS, etc.)
 - * QoS configuration of route/switch network devices
 - * Cisco UCS B-Series chassis and switching components (e.g. Cisco UCS 6100/6200, Cisco UCS 2100/2200, Cisco UCS 5100)
- * Storage arrays (such as those from EMC, NetApp or other vendors)

NEW QUESTION: 3

- A. Main Mode
- B. Fast Mode
- C. Aggressive Mode
- D. Diffie-Hellman Mode
- E. Quick Mode

Answer: A,C,E

Explanation:

<https://supportforums.cisco.com/t5/security-documents/main-mode-vs-aggressive-mode/ta-p/3123382> Main Mode - An IKE session begins with the initiator sending a proposal or proposals to the responder.

The proposals define what encryption and authentication protocols are acceptable, how long keys should remain active, and whether perfect forward secrecy should be enforced, for example. Multiple proposals can be sent in one offering. The first exchange between nodes establishes the basic security policy; the initiator proposes the encryption and authentication algorithms it is willing to use. The responder chooses the appropriate proposal (we'll assume a proposal is chosen) and sends it to the initiator. The next exchange passes Diffie-Hellman public keys and other data. All further negotiation is encrypted within the IKE SA. The third exchange authenticates the ISAKMP session. Once the IKE SA is established, IPsec negotiation (Quick Mode) begins.

Aggressive Mode - Aggressive Mode squeezes the IKE SA negotiation into three packets, with all data required for the SA passed by the initiator. The responder sends the proposal, key material and ID, and authenticates the session in the next packet. The initiator replies by authenticating the session. Negotiation is quicker, and the initiator and responder ID pass in the clear.

Quick Mode - IPsec negotiation, or Quick Mode, is similar to an Aggressive Mode IKE negotiation, except negotiation must be protected within an IKE SA. Quick Mode negotiates the SA for the data encryption and manages the key exchange for that IPsec SA.
