NEW QUESTION: 1
Your customer accounts revenue based on product class category. Because all your customer's projects are funded by private and government institutions, they decide to classify all projects based on their funding source to accurately report on revenue in
General Ledger. Accordingly, you create a new class category "Funding Source", and assign it to all projects. However, you notice that the accounting is still happening based on product class category.
Identify the reason for this problem. (Choose the best answer.)

A. Funding source class category is enabled for "available as accounting source".
B. Funding source class category is assigned to all project types.
C. Product class category is not enabled for "available as accounting source".
D. Funding source class category is not enabled for "available as accounting source".

NEW QUESTION: 3
What is the correct sequence which enables an authorized agency
to use
the Law Enforcement Access Field (LEAF) to decrypt a message
sent by
using the Clipper Chip? The following designations are used for
the
respective keys involved Kf, the family key; Ks, the session
key; U, a

unique identifier for each Clipper Chip and Ku, the unit key that is
unique to each Clipper Chip.
A. Obtain a court order to acquire the family key, Kf; recover U and Ku; then recover Ks, the session key. Use the session key to decrypt the message.
B. Obtain a court order to acquire the two halves of Ku, the unit key.
Recover Ku. Decrypt the LEAF with Ku and then recover Ks, the session key. Use the session key to decrypt the message.
C. Decrypt the LEAF with the family key, Kf; recover U; obtain a court
order to obtain the two halves of Ku; recover Ku; and then recover Ks,
the session key. Use the session key to decrypt the message.
D. Decrypt the LEAF with the family key, Kf; recover U; obtain a court
order to obtain Ks, the session key. Use the session key to decrypt the message.
Answer: C
Explanation:
The explanation is based on the LEAF as shown in the Figure.

image018
The message is encrypted with the symmetric session key, Ks. In order to decrypt the message, then, Ks must be recovered. The LEAF contains the session key, but the LEAF is encrypted with the family key, Kf , that is common to all Clipper Chips. The authorized agency has
access to Kf and decrypts the LEAf. However, the session key is still
encrypted by the 80-bit unit key, Ku, that is unique to each Clipper
Chip and is identified by the unique identifier, U. Ku is divided into
two halves, and each half is deposited with an escrow agency. The
law enforcement agency obtains the two halves of Ku by presenting
the escrow agencies with a court order for the key identified by U.
The two halves of the key obtained by the court order are XORed together to obtain Ku. Then, Ku is used to recover the session key, Ks, and Ks is used to decrypt the message.
The decryption sequence to obtain Ks can be summarized as:

image020
This is the sequence described in answer "Decrypt the LEAF with the family key, Kf; recover U; obtain a court order to obtain the two halves of Ku; recover Ku; and then recover Ks,
the session key. Use the session key to decrypt the message".
The sequences described in the other answers are incorrect.

NEW QUESTION: 4
What does the Server-side encryption provide in Amazon S3?
A. Server-side encryption allows to upload files using an SSL endpoint for a secure transfer.
B. Server-side encryption provides an encrypted virtual disk in the cloud.
C. Server-side encryption doesn't exist for Amazon S3, but only for Amazon EC2.
D. Server-side encryption protects data at rest using Amazon S3-managed encryption keys (SSE-S3).
Answer: D
Explanation:
Server-side encryption is about protecting data at rest. Server-side encryption with Amazon S3- managed encryption keys (SSE-S3) employs strong multi-factor encryption. Amazon S3 encrypts each object with a unique key. As an additional safeguard, it encrypts the key itself with a master key that it regularly rotates.
