#### **NEW QUESTION: 1**

Which three statements about implementing a NAT application layer gateway in a network are true? (Choose three.)

- A.** An application layer gateway inspects only the first 64 bytes of a packet before forwarding it through the network.
- B.** It allows synchronization between multiple streams of data between two hosts.
- C.** It maintains granular security over application-specific data.
- D.** Client applications require additional configuration to use an application layer gateway.
- E.** It allows client applications to use dynamic ports to communicate with a server regardless of whether NAT is being used.
- F.** Application layer gateway is used only in VoIP/SIP deployments.

**Answer: B,C,E**

Explanation:

An application-level gateway (ALG), also known as an application-layer gateway, is an application that translates the IP address information inside the payload of an application packet. An ALG is used to interpret the application-layer protocol and perform firewall and Network Address Translation

(NAT) actions. These actions can be one or more of the following depending on your configuration of the firewall and NAT: Reference.

### **NEW QUESTION: 2**

Ferris Plastics, Inc. is a medium sized company, with an enterprise network (access, distribution and core switches) that provides LAN connectivity from user PCs to corporate servers. The distribution switches are configured to use HSRP to provide a high availability solution.

DSW1 -primary device for VLAN 101 VLAN 102 and VLAN 105

DSW2 - primary device for VLAN 103 and VLAN 104

A failure of GigabitEthernet1/0/1 on primary device should cause the primary device to release its status as the primary device, unless GigabitEthernet1/0/1 on backup device has also failed. Troubleshooting has identified several issues. Currently all interfaces are up. Using the running configurations and show commands, you have been asked to investigate and respond to the following question.

All interfaces are active. DSW2 has not become the active device for the VLAN 103 HSRP group. As related to the VLAN 103 HSRP group, what can be done to make the group function properly?

**A.** On DSW1, disable preempt.

**B.** On DSW1, decrease the priority value to a value less than 190 and greater than 150.

**C.** On DSW2, increase the priority value to a value greater 200 and less than 250.

**D.** On DSW2, increase the decrement value in the track command to a value greater than 10 and less than 50.

**Answer: C**

Explanation:

From the output shown below of the HSRP status of DSW2, we see that the active router has a priority of 200, while the local priority is 190. We need to increase the priority of DSW2 to greater than 200, but it should be less than 250 so that if the gig 1/0/1 interface goes down, DSW1 will become active. DSW2 is configured to decrement the priority by 50 if this interface goes down, so the correct answer is to increase the priority to more than 200, but less than 250.

### **NEW QUESTION: 3**

You have a Microsoft 365 subscription that includes a user named Admin1.
